

Ovidius TreeVision

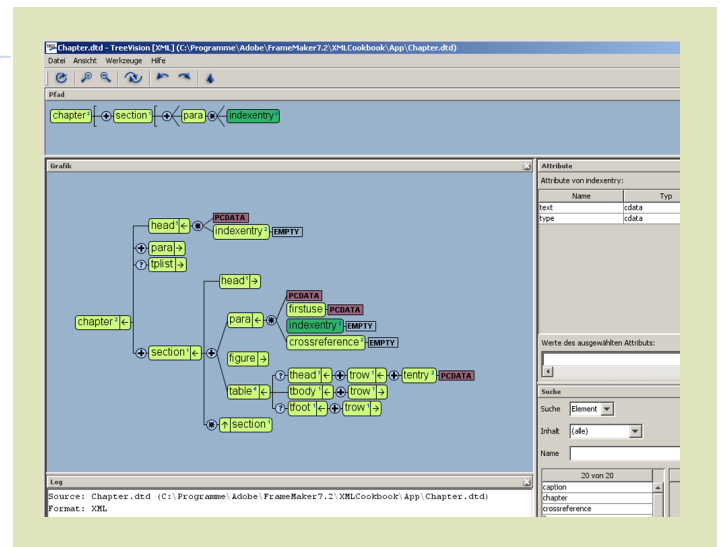

An easy way of visualising and analysing DTDs

Are you working with structured data on a daily basis and need a tool to analyse DTDs in an easy way? Ovidius TreeVision: A tool to view and analyse XML and SGML DTDs. Ovidius TreeVision offers more than just closing the gap left by other popular DTD viewers.

TreeVision Features

TreeVision supports SGML and XML DTDs and makes comprehensive analysis possible, because of the following:

- DTDs are shown even when they are incomplete or not valid (within the possibilities of the given information). You will never lose your orientation with TreeVision.
- Information can be zoomed in or out.
- TreeVision displays a tree of the structure. For every selected node the complete path can be shown. This is especially useful in the development of formatting applications for determining the contexts of elements.
- Elements and attributes can quickly and easily be found. A search can be conducted on elements limited on special contents. Also the search for attributes can be limited - only finding special attribute types. The information about the context of one element is delivered within one click.
- A powerful graphical export is included in version 1 of TreeVision. For example, if someone needs a graphical illustration for training material of a special node in user-defined depth, this is supported by Ovidius TreeVision. Selected elements can be exported as PNG-graphics. For larger print output just choose the 'Wallpaper' function and create your own wallpaper. There are some known Software-DTDs where – at the correct resolution – a complete room could be decorated.
